# The Care Ecosystem: Navigating Patients and Families through Stages of Care

Southern CA Alzheimer's Disease Research Conference

September 9, 2022

Kate Possin, PhD  
John Douglas French Foundation Endowed Professorship  
Professor in Residence  
Memory and Aging Center  
University of California San Francisco

*It took nearly 4 years for us to get a diagnosis.  
The doctor told us it was Alzheimer's, that there was  
nothing he could do, and to come back in a year. We  
were first devastated, then angry. I also have  
diabetes, and I got medication, education and care  
management for that. Now I have a fatal brain  
disease, and I got 'diagnose and adios.'  
We have to do better.*

# Dementia care is too often crisis-oriented and fragmented

- Frequent **emergency department** visits and hospitalizations (Hunt, Coombs, et al., 2018; Zhu, Cosentino et al., 2015)
- Multiple **care transitions** (Callahan, Tu, et al., 2015)
- Inappropriate and potentially harmful **medication use** (Maust, Kim, et al., 2015)
- Aggressive **end of life care** that is often inconsistent with the patient's values (Mitchell, Teno, Kiely et al., 2009)
- Informal caregivers shoulder **substantial burdens** with minimal support from our patient-centric healthcare models
  - When caregivers are depressed, PWLD use the ED more (Guterman, Allen, et al., 2019)
- The **COVID-19 pandemic** has disproportionately disrupted the lives of people living with dementia and their caregivers (Ibáñez, Pina-Escudero et al., 2021)

# Dementia Caregivers Report High Emotional and Physical Stress Due to Caregiving

# The Care Ecosystem Model

The Care Team Navigator (CTN) is at the Center

# Who is a Care Team Navigator or “CTN”?

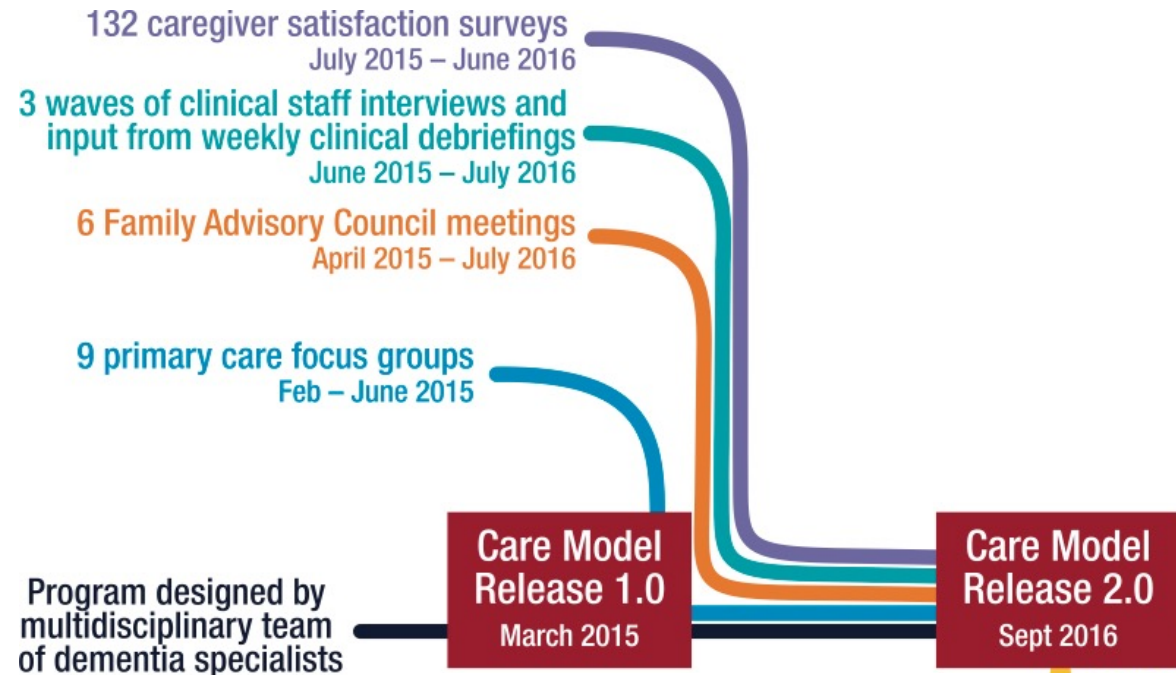

- A friendly, empathic, and organized person who loves working with people
- Health care background not required
- CTN is trained, supervised, and supported by a clinical team
- CTN provides telephone-based care coordination, education, and support

## Care Modules

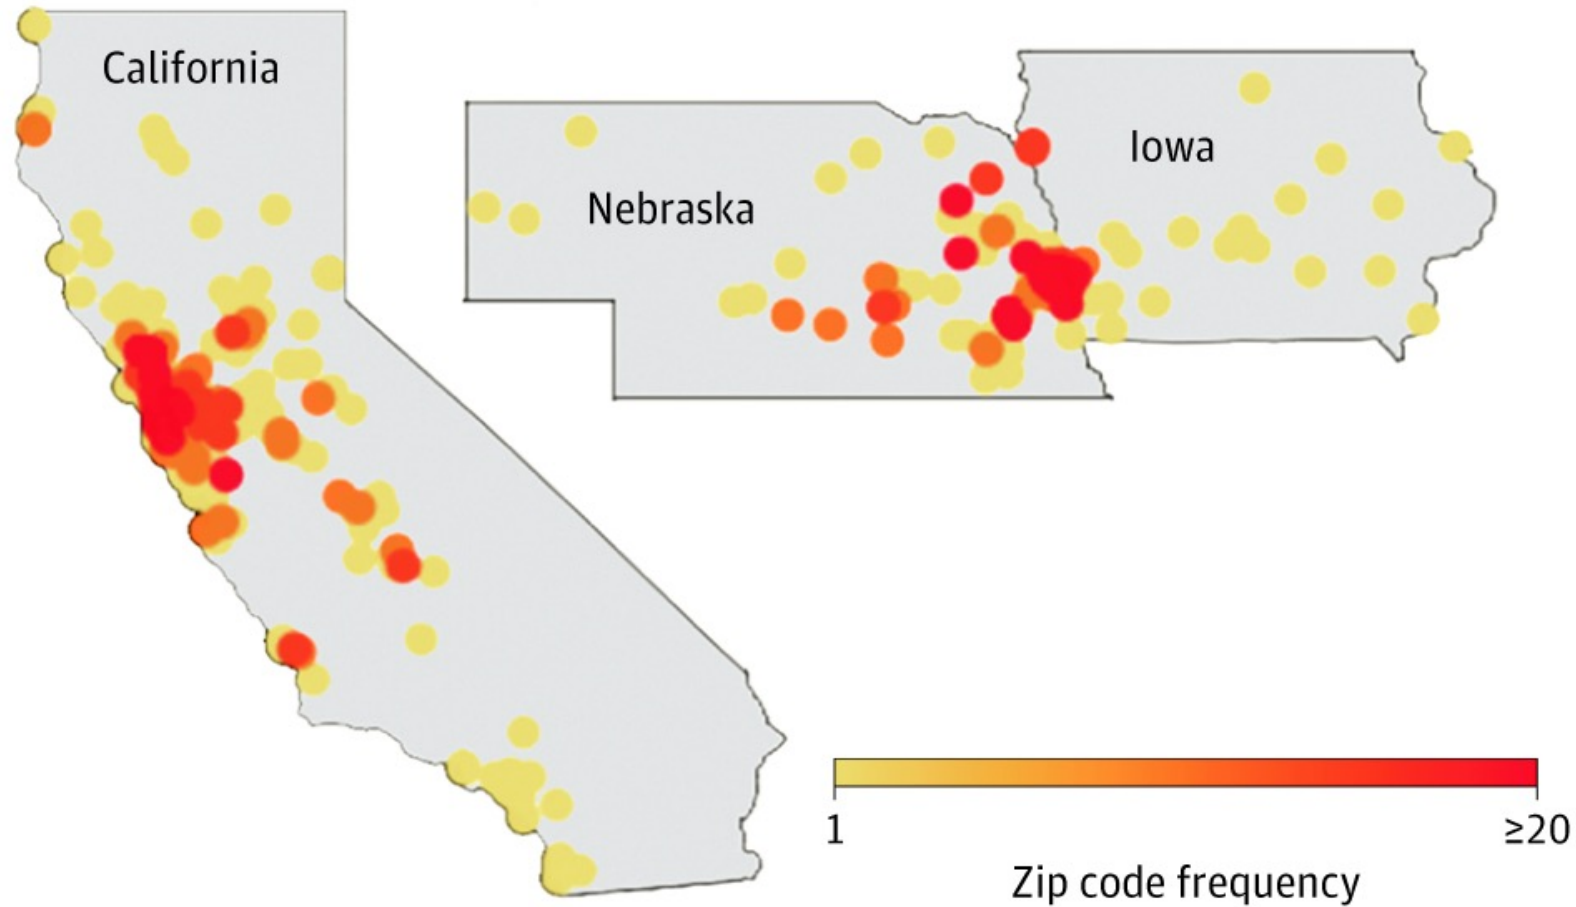

# Agile Development of the Care Model

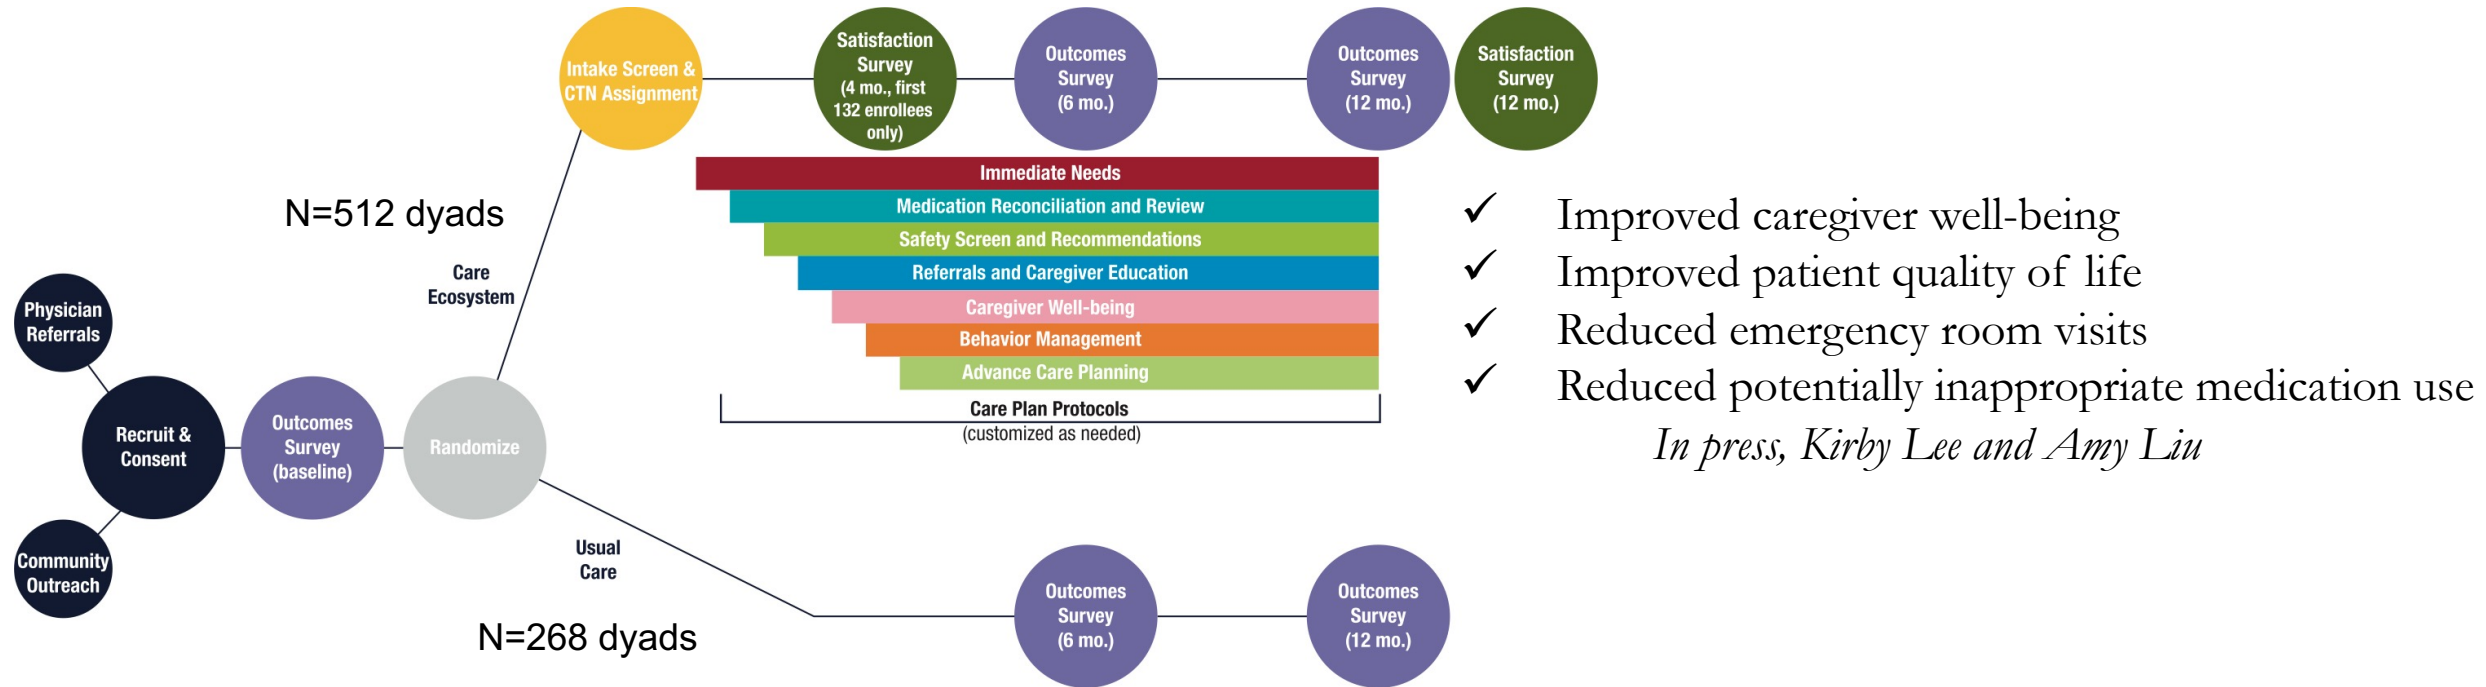

# Randomized Trial: Locations of patients enrolled

# Randomized Trial: Design & Results

# Scientists have a critical role in bridging the science-practice gap

- Scientists too often expect that the implementation and dissemination of their interventions will be taken up by other parties, which is often not the case (Callahan, Bateman, et al., 2018)
- As scientists, we need to understand the barriers to the dissemination of effective dementia care, and trial implementation methods to bridge the gap. (Boustani, Unützer, Leykum, 2021; National Academies of Sciences, Engineering, and Medicine Report, 2021)

# The AHRQ's systematic review, and the National Academies of Science's consensus study report, summarize the evidence on effective dementia care models

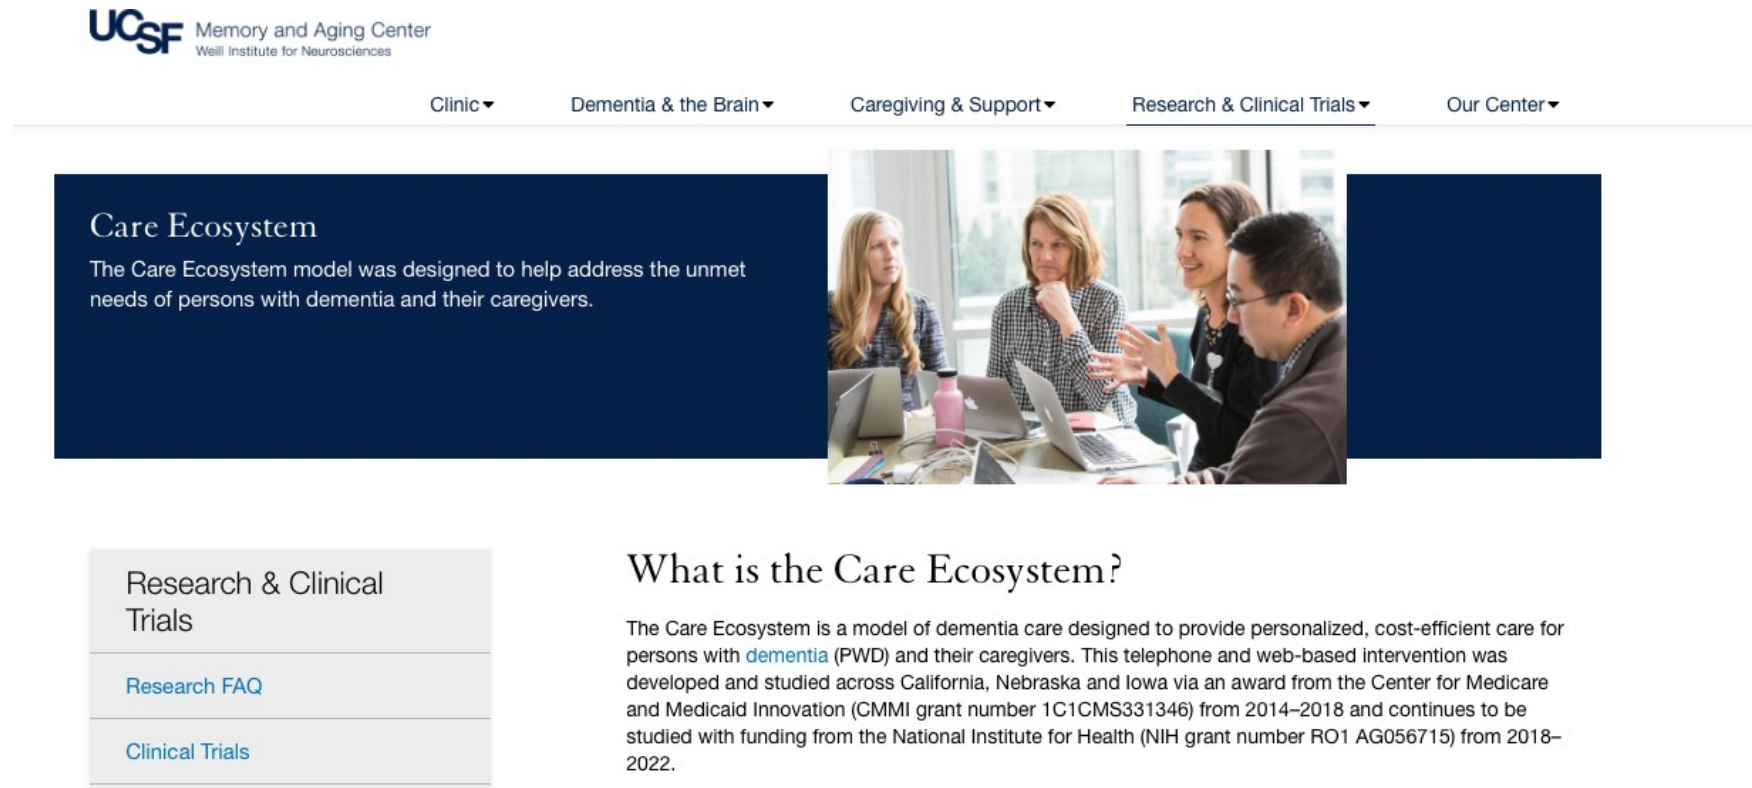

Evidence is sufficient to justify implementation of collaborative care models, including the Care Ecosystem and the UCLA program, in a broad spectrum of community settings, with evaluation conducted to continue expanding the evidence base.

Sarah Dulaney, CNS  
Care Ecosystem  
Clinical Director

The screenshot shows the UCSF Memory and Aging Center website. The header includes the UCSF logo and the text "Memory and Aging Center" and "Weill Institute for Neurosciences". Navigation links are: Clinic, Dementia & the Brain, Caregiving & Support, Research & Clinical Trials (selected), and Our Center. The main content area features a dark blue box with the title "Care Ecosystem" and the text: "The Care Ecosystem model was designed to help address the unmet needs of persons with dementia and their caregivers." To the right of this box is a photograph of four people (three women and one man) sitting around a table, engaged in a discussion. Below the main content area, there is a sidebar with a menu: "Research & Clinical Trials" (selected), "Research FAQ", and "Clinical Trials". The main text area below the sidebar is titled "What is the Care Ecosystem?" and contains a paragraph describing the Care Ecosystem model.

## Care Ecosystem

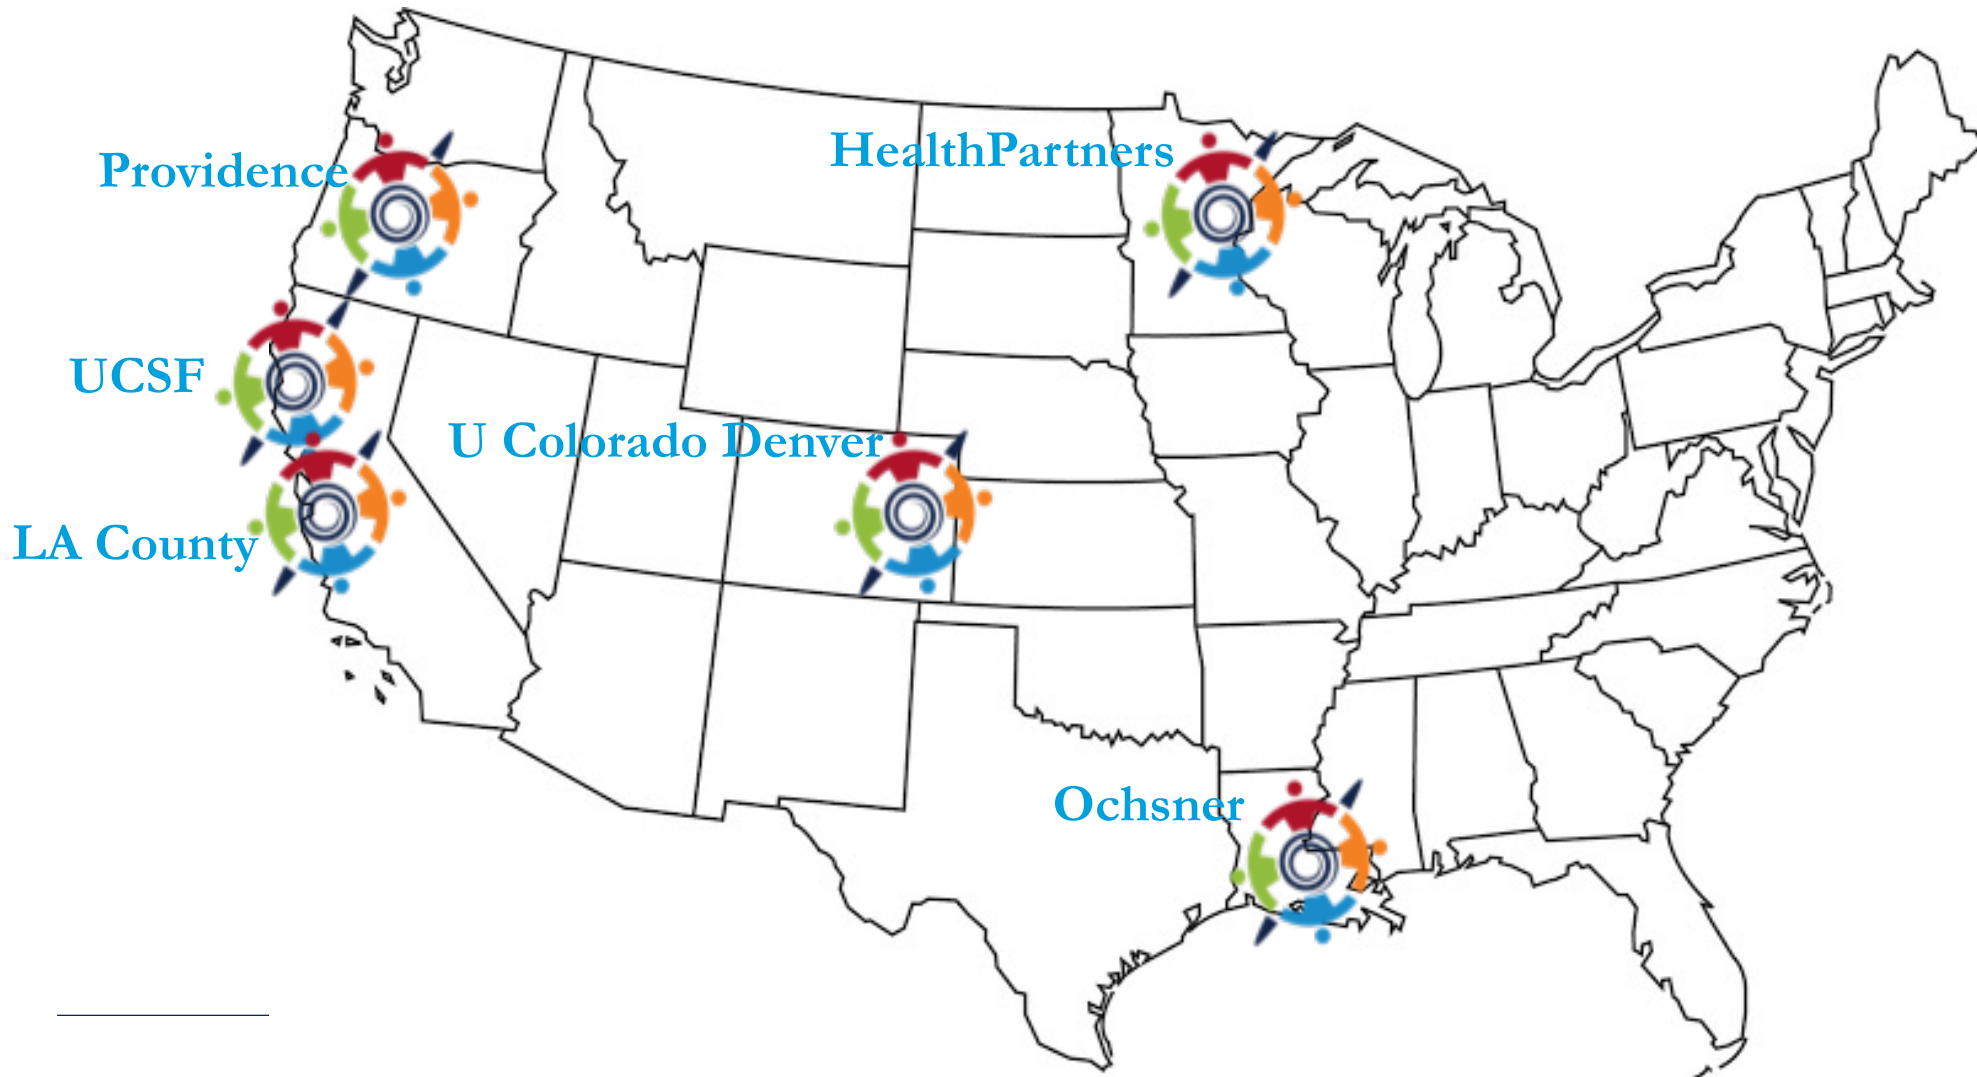

The Care Ecosystem model was designed to help address the unmet needs of persons with dementia and their caregivers.

### What is the Care Ecosystem?

The Care Ecosystem is a model of dementia care designed to provide personalized, cost-efficient care for persons with **dementia** (PWD) and their caregivers. This telephone and web-based intervention was developed and studied across California, Nebraska and Iowa via an award from the Center for Medicare and Medicaid Innovation (CMMI grant number 1C1CMS331346) from 2014–2018 and continues to be studied with funding from the National Institute for Health (NIH grant number RO1 AG056715) from 2018–2022.

Concern

↓

Detect,  
Diagnose,  
and Treat

PLWD & caregivers are navigated by a care team that personalizes care goals to their needs and prioritizes their quality of life

“These treatments and care practices will neither prevent nor cure Alzheimer’s or other dementias, but they will help to change the experience of people with the conditions and their family caregivers – helping them to manage and cope with the difficult situations caused by the conditions and live as well as possible despite them.”

Katie Maslow, MSW

# The UCSF Memory and Aging Center

The mission of the UCSF Memory and Aging Center is to provide the highest quality of care for individuals with cognitive problems, to conduct research on causes and cures for degenerative brain diseases, and to educate health professionals, patients and their families.
